Service, Repair, and Return Policies and Instructions

The information contained in this document supersedes all similar information that may be found elsewhere in this manual.

Service – Due to the sophisticated nature of the sensors and associated instrumentation provided by PCB Piezotronics, user servicing or repair is not recommended and, if attempted, may void the factory warranty. Routine maintenance, such as the cleaning of electrical connectors, housings, and mounting surfaces with solutions and techniques that will not harm the physical material of construction, is acceptable. Caution should be observed to ensure that liquids are not permitted to migrate into devices that are not hermetically sealed. Such devices should only be wiped with a dampened cloth and never submerged or have liquids poured upon them.

Repair – In the event that equipment becomes damaged or ceases to operate, arrangements should be made to return the equipment to PCB Piezotronics for repair. User servicing or repair is not recommended and, if attempted, may void the factory warranty.

Calibration – Routine calibration of sensors and associated instrumentation is recommended as this helps build confidence in measurement accuracy and acquired data. Equipment calibration cycles are typically established by the users own quality regimen. When in doubt about a calibration cycle, a good “rule of thumb” is to recalibrate on an annual basis. It is

also good practice to recalibrate after exposure to any severe temperature extreme, shock, load, or other environmental influence, or prior to any critical test.

PCB Piezotronics maintains an ISO-9001 certified metrology laboratory and offers calibration services, which are accredited by A2LA to ISO/IEC 17025, with full traceability to SI through N.I.S.T. In addition to the normally supplied calibration, special testing is also available, such as: sensitivity at elevated or cryogenic temperatures, phase response, extended high or low frequency response, extended range, leak testing, hydrostatic pressure testing, and others. For information on standard recalibration services or special testing, contact your local PCB Piezotronics distributor, sales representative, or factory customer service representative.

Returning Equipment – *Following these procedures will ensure that your returned materials are handled in the most expedient manner.* Before returning any equipment to PCB Piezotronics, contact your local distributor, sales representative, or factory customer service representative to obtain a **Return Warranty, Service, Repair, and Return Policies and Instructions** Materials Authorization (RMA) Number. This RMA number should be clearly marked on the outside of all package(s) and on the packing

list(s) accompanying the shipment. A detailed account of the nature of the problem(s) being experienced with the equipment should also be included inside the package(s) containing any returned materials.

A Purchase Order, included with the returned materials, will expedite the turn-around of serviced equipment. It is recommended to include authorization on the Purchase Order for PCB to proceed with any repairs, as long as they do not exceed 50% of the replacement cost of the returned item(s). PCB will provide a price quotation or replacement recommendation for any item whose repair costs would exceed 50% of replacement cost, or any item that is not economically feasible to repair. For routine calibration services, the Purchase Order should include authorization to proceed and return at current pricing, which can be obtained from a factory customer service representative.

Contact Information – International customers should direct all inquiries to their local distributor or sales office. A

complete list of distributors and offices can be found at wwwpcb.com. Customers within the United States may contact their local sales representative or a factory customer service representative. A complete list of sales representatives can be found at wwwpcb.com. Toll-free telephone numbers for a factory customer service representative, in the division responsible for this product, can be found on the title page at the front of this manual. Our ship to address and general contact numbers are:

1.0 INTRODUCTION

Charge mode pressure sensors offer high performance for precise pressure measurements over a wide range of near-static and dynamic pressures. The sensors use piezoelectric properties to convert an applied pressure into an analogous electrical charge.

The internal design of a sensor incorporates a sensing element that provides high sensitivity over a wide range of pressures. As pressure is applied to the diaphragm of the sensor, a charge is generated in the crystals. The high-impedance electrostatic charge is then conditioned externally by either a laboratory-style charge amplifier or in-line charge converter prior to being sent to a readout or recording device.

Charge mode sensors are ideally suited for applications where wide dynamic range is needed. Such applications include compressors, engines, blast, ballistic, pneumatic, hydraulic, and fluid pressures. Enclosed is a Specification Sheet that lists the complete performance characteristics of the sensor purchased.

2.0 Series 176 High Temperature Differential Output Sensor

The Series 176 High temperature differential output sensor is a special-purpose high temperature charge mode pressure sensor designed specifically to measure low-level pressures in severe environments. The unit is most frequently used in engines, hydraulic and pneumatic devices, compressors and turbines. Ideal for sound pressure measurements, microphones and small pressure agitations, its maximum dynamic pressure range is 100 psi (689 kPa). It is acceleration compensated to minimize vibration sensitivity and is capable of a five-microsecond rise time.

This sensor measures transient or repetitive phenomena relative to the initial or average pressure level, over a wide amplitude range and a usable frequency range near DC to 10 000 Hz; the resonant frequency is 50 000 Hz. The operating temperature for the Series 176 ranges from 0°F to 1000°F. This hermetically sealed sensor contains extremely rigid compression-mode crystals with an integral acceleration compensating crystal to reduce vibration sensitivity and partially suppress internal resonance effects.

3.0 Installation

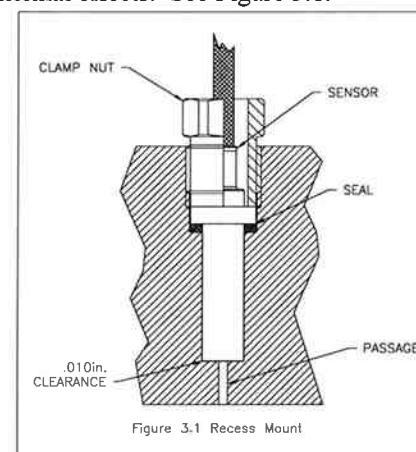

3.1 Overview

When choosing an installation method, the advantages and disadvantages of each method must be carefully weighed. Characteristics like location, ruggedness, amplitude range, accessibility, temperature and portability may be greatly affected by the installation configuration and technique. Often, the most important and overlooked consideration is the affect the mounting technique has on the frequency of the pressure being measured by the sensor.

Two basic mounting techniques are recommended for pressure sensors: the recess mount and the flush mount. The technique used is determined by the specifics of the individual application. See the Installation Drawing in this manual for additional details on the individual sensor series.

3.2 Recess Mount

A recess mount protects the sensor diaphragm from the effect of high flash temperature and particle impingement. This method is often selected because it can prolong sensor life and increase data integrity by reducing thermal effects. See Figure 3.1.

When using a recess mount, note that the length of the passage may limit the frequency range of the measurement. The effect the passage has is similar to that of an under-damped second order system, with the resonant frequency determined by passage length. The passage length thus limits pressure pulse rise time and may also cause passage ringing.

The function is described by the following equation:

$$F_r = \frac{V}{4L}$$

Where: F_r = resonant frequency passage (Hz)
 V = velocity of sound in air (feet/second)
 L = length of column (feet)

For air at room temperature, the equation becomes:

$$F_r = \frac{3300}{L}$$

Where: L = passage length (inches)

The natural frequency and approximately fastest pressure step rise time for various length passages are shown in the following chart, using a medium of air at 77°F (25°C).

Selected Values for 77°F (25°C)

Passage length (inches)	Passage resonance (kHz)	Approx. fastest pulse rise time (microseconds)
.050	66	5
.100	33	10
.200	16.5	20
.50	6.6	50
1.0	3.3	100

Measured resonant frequencies may differ slightly from the chart values due to variations in the velocity of sound in the air from changes in temperature and pressure of the air in the passage.

To ensure diaphragm integrity, maintain .006 inches (.153 mm) of clearance ahead of the diaphragm as shown in Figure 3.1.

3.3 Flush Mount

In a flush mount installation, there is no reduced area passage from the sensor diaphragm to the test chamber. Instead, the sensor diaphragm is mounted flush with, or slightly recessed from, the inside surface of the test chamber. See Figure 3.2.

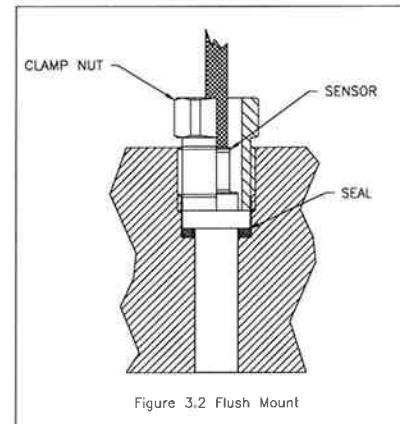

Figure 3.2 Flush Mount

If thermal transients or diaphragm impingement are concerns, use the flush mount technique only when space or frequency response considerations preclude the use of the recess mount installation.

In severe or pyrotechnic environments, sensor life may be seriously curtailed when using this mounting method.

3.4 Cabling

Care and attention to cable attachment is essential, as the reliability and accuracy of your system is no better than that of the output cable. First, check that you have ordered the correct cable type. As with sensors, no cable can satisfy all applications. Special low-noise cabling shielded twisted pair should be used with high-impedance, charge output devices.

Plug the connector on the cable into the mating connector on the sensor. Then, holding the sensor stationary, secure the connector in place by tightening down the attached cable sleeve.

Route the cable to a charge amplifier or in-line charge converter, making certain to strain relieve the sensor/cable connection and minimize motion by clamping the cable at regular intervals. Common sense must be used to avoid physical damage and minimize electrical noise. Avoid routing cables near high voltage wires. Do not route cables along floors or walkways where they may be stepped on or become contaminated. Shielded cable should have the shield grounded at one end only.

To dissipate any charge that may have accumulated in the cable, short the pins to ground prior to attachment to the charge amplifier or charge converter.

4.0 CALIBRATION

These sensors may be calibrated using static hydraulic techniques, such as dead-weight testers, or by comparison with a reference gage.

When calibrating with a laboratory-style charge amplifier, set the charge amplifier to LONG, for the time constant setting, and allow the sensor to stabilize before applying pressure. If slow drift is apparent, apply the pressure to the desired level, and immediately take a reading. Release the pressure and take another reading at zero pressure to obtain the difference between the readings at the desired present level and zero pressure. If the drift is too fast to take a reading, clean the cable connections according to the procedures outlined in Section 7.0, Maintenance.

NOTE: Do not attempt to use a charge amplifier which, in the long time constant position, has less than a 5 000-second time constant for quasi-static calibration of charge sensors. Any drift may cause error.

A factory-supplied, NIST-traceable calibration graph is provided with each sensor, certifying its charge sensitivity in pC/psi, or when used with an in-line amplifier, in mV/psi.

5.0 Normal Operation

The high impedance signal generated by a charge output sensor is usually conditioned with a laboratory-style charge amplifier. The charge amplifier converts the high-impedance charge signal generated by the sensor into a low-impedance voltage signal. This signal may then be transmitted to a readout or recording device for analysis. See Figure 5.1 for a drawing of a typical system connection.

NOTE: When using charge-amplified systems, the noise floor of the system is dependent on the input capacitance to the charge amplifier. To minimize noise, keep the cable length between the pressure sensor and the charge amplifier to a minimum. Cable length does not affect the system sensitivity.

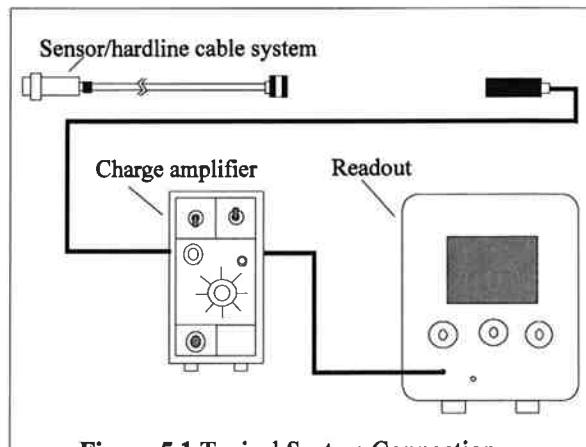

Figure 5.1 Typical System Connection

Before connecting the low-noise cable from the pressure sensor to the charge amplifier, be certain to ground the charge amplifier. This ensures that any excessive accumulated static charges across the sensor/cable combination are harmlessly discharged. If this precaution is not observed, the input FET of certain amplifiers may be destroyed. Press the ground button of the charge amplifier and adjust electrical zero if necessary.

Once system components are connected, wait a few minutes for the system to thermally stabilize. Place the switch in the OPR (operate) position and proceed with the measurement. Refer to the charge amplifier operating manual for further operating details.

For fixed sensitivity in-line charge amplifiers, the system sensitivity (mV/psi) is determined as the product of the charge amplifier sensitivity (mV/pC) and the sensor sensitivity (pC/psi).

6.0 HIGH-TEMPERATURE OPERATION

6.1 Introduction

When subjected to elevated temperature, all piezoelectric sensors/hardline cable systems exhibit decreased insulation resistance, due in part to the piezoelectric element, but due mostly to the hardline cable necessary to withstand the high temperatures. This situation can cause serious voltage offset problems in direct-coupled charge amplifiers. To solve this problem, the user must AC couple (capacitor) the charge amplifier

to the sensor/cable system. See Section 6.3, Solution to Reduced Resistance, for complete details, or use different amplifiers.

6.2 Reduced Resistance at Charge Amplifier Input

Figure 6.1 illustrates a simplified schematic of a typical direct-coupled charge amplifier where:

- R_f = Feedback resistor (ohms)
- R_i = Input leakage resistance (ohms)
- E_o = Steady-state output voltage (volts)
- e_i = Offset voltage: FET leakage (volts)
- C_f = Feedback capacitor (farads)

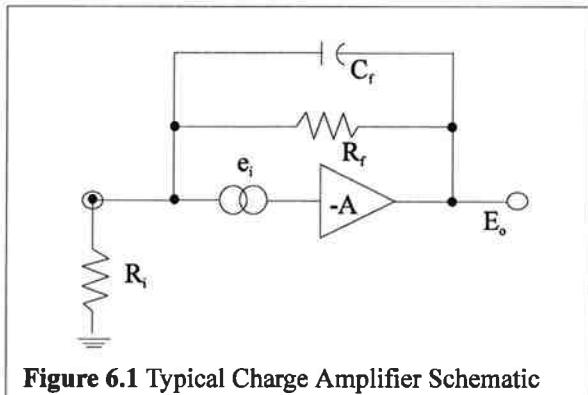

Figure 6.1 Typical Charge Amplifier Schematic

The feedback capacitor C_f comes into play only in the dynamic situation and its influence does not affect the steady-state situation. The voltage e_i is a DC offset voltage, usually very tiny (microvolts), that exists at the input gate of the MOSFET circuit. This minute leakage current exists in all real devices.

As demonstrated in Equation 1, the steady-state (DC) output voltage E_o is:

Equation 1

$$E_o = e_i \left(1 + \frac{R_f}{R_i} \right)$$

This equation shows that if the input (leakage) resistance at the charge amplifier is extremely high (approaching infinity), the output DC voltage approaches e_i , usually a very tiny voltage. However, as R_i decreases, the term

$$1 + \frac{R_f}{R_i}$$

increases, such that the output voltage can, with large ratios of R_f / R_i , become large enough to result in a large E_o , perhaps large enough to be outside the normal output voltage range of the charge amplifier.

Because of the feedback capacitor C_f , this output voltage change usually does not occur rapidly but rather, it manifests itself as a slow drift in the output voltage level. If R_i is low enough with respect to R_f , the voltage drift may continue until saturation of the charge amplifier occurs.

6.3 Solution to Reduced Resistance

Since the drift or offset problem is caused by a static or steady-state imbalance at the input of the charge amplifier, the solution involves blocking this steady-state effect while allowing the desired dynamic phenomena to pass. This may be accomplished by installing a series capacitor at the input of the charge amplifier, between the offending sensor (or low-impedance hardline) and the input.

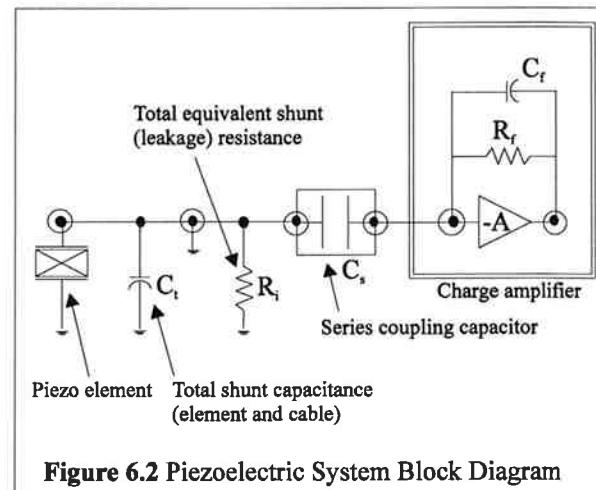

Figure 6.2 Piezoelectric System Block Diagram

Figure 6.2 illustrates a block diagram of the piezoelectric system where:

- C_t = Shunt capacitor
- C_s = Series blocking capacitor

With the series blocking capacitor C_s in place as shown, the dynamic charge (Q) generated by the sensor element is distributed across the two capacitors, C_t and C_s , in proportion to the size (capacitance) of each. If C_s , for example, is equal to 100 times C_t , 99% of the charge appears at the input of the charge amplifier, while 1% is

across the shunt capacitor C_t . This results in a 1% decrease in apparent sensitivity of the system.

This therefore demonstrates the importance of selecting the series blocking capacitor at least two orders of magnitude higher than the total shunt capacitance C_t across the input of the charge amplifier.

It is also important that this capacitor be of high quality, with a leakage resistance of greater than 10^{12} ohms, to avoid the DC offset discussed previously in 6.1, Introduction.

6.4 Low-Frequency Response Limitations

In a normal charge amplifier, the low-frequency response is set by the RC time constant, as established by the product of C_f and R_f . The system acts like a high-pass first order RC filter with a -3 dB frequency established by the relationship:

Equation 2

$$f_o = \frac{.16}{R_f C_f}$$

where:

- f_o = -3 dB Frequency (Hz)
- R_f = Feedback resistor (ohms)
- C_f = Feedback capacitor (farads)

However, after the addition of the series blocking capacitor C_s , the system becomes the equivalent of two high-pass filters in series, one as previously mentioned and one comprised of series capacitor C_s and total equivalent shunt resistance R_i . This new cutoff frequency is:

Equation 3

$$f_o = \frac{.16}{R_i C_s}$$

To avoid compromise of the low-frequency response established by the charge amplifier parameters and illustrated by Equation 2, the product of $R_i C_s$ should be several orders of magnitude higher than $R_f C_f$.

The approximate final system discharge time constant becomes:

Manual Number: 30737

Revision: A

ECR Number: 24690

Equation 4a

$$TC = \frac{1}{\frac{1}{R_i C_s} + \frac{1}{R_f C_f}} \quad \text{seconds}$$

If the input coupling time constant ($R_i C_s$) is very much greater than the discharge time constant of the charge amplifier ($R_f C_f$), Equation 4a then becomes:

Equation 4b

$$\frac{1}{R_i C_s} \Rightarrow 0 \text{ Seconds}$$

Equation 5

$$TC = R_f C_f$$

With the product $R_i C_s$ chosen to be much greater than $R_f C_f$, the system discharge time constant is simply $R_f C_f$ (seconds). The feedback parameters of the charge amplifier establish the low frequency characteristics of the system, unaffected by the degraded input resistance parameters of the test sensor and/or cable.

6.5 Other Precautions

Always remember to keep the OPR-GND switch on the charge amplifier in the GND position while connecting or disconnecting sensors, cable, or capacitor to the input connector. Stray or accumulated electrostatic charges may build to the point that they may saturate or even damage the input circuitry of the charge amplifier.

Operate the charge amplifier in the SHORT time constant while the sensor is subject to elevated or changing temperatures.

If it is not necessary to procure data during the transition from room temperature to operating temperature, place the OPR-GND switch in the GND position to keep spurious, thermally generated charges grounded.

It is prudent to momentarily switch to the GND position even during the measurement period to ensure that excess charges do not accumulate at the input of the charge amplifier.

7.0 MAINTENANCE

The only maintenance required on the pressure sensor is to keep the connector clean. If it is operating in a dirty environment, protect the cable connections with heat-shrink tubing or similar material.

In the event that the electrical connection of the pressure sensor becomes contaminated with dirt or moisture, the insulation resistance degrades. This may cause a reduction of sensitivity or excessive drifting when connected to the charge amplifier. If this happens, brush off the connector with no-residue solvent or other approved cleaning solutions. To restore insulation, bake the sensor in a vacuum oven at 250°F for about four hours. If the condition persists even after cleaning and/or baking, please contact a PCB applications engineer for further assistance. The sensor is hermetically sealed; it must therefore be returned to the factory if the aforementioned measures fail to restore performance.

3. ОПИСАНИЕ КОНСТРУКЦИИ И СРЕДСТВ ОБЕСПЕЧЕНИЯ ВЗРЫВОЗАЩИЩЕННОСТИ

Преобразователи состоят из пьезоэлектрического чувствительного элемента и усилительно-преобразующей платы, которые залиты высокотемпературным герметиком и установлены в корпусе из нержавеющей стали. На наружной поверхности корпуса нанесена маркировка.

Преобразователи EX600XXX состоят из пьезоэлектрического сенсора, соединенного бронированным кабелем длиной до 10 м с усилителем заряда, выполненным в стальном корпусе. Металлическая броня кабеля приварена к корпусам сенсора и усилителя заряда.

Преобразователи могут быть выполнены с постоянно закрепленным кабелем с герметичным разъемом на свободном конце или с установленным на корпусе герметичным разъемом.

Вибровыключатели выполнены во взрывозащищенных оболочках, в качестве которых применены цилиндрические или прямоугольные корпуса, закрытые крышкой со стопорным винтом типа 2HKB-B-2GLD производства фирмы Killaré или типа XJSHX-N4 производства фирмы Adalet или типа SA090907 производства фирмы Cortem, и предназначены для непосредственного монтажа на контролируемом оборудовании. Внутри корпуса установлен пьезоэлектрический акселерометр, электронный блок и клеммные зажимы для подключения внешних электрических цепей. На боковых поверхностях корпуса расположены резьбовое отверстие под кабельный ввод, механический регулятор чувствительности, кнопка обнуления и заземляющий зажим. На крышке закреплена табличка с маркировкой.

Усилители заряда EX682XYYY выполнены в унифицированном пластмассовом корпусе, в котором расположены печатные платы с элементами электронной схемы. На торцах верхней поверхности корпуса расположены клеммные зажимы для подключения входных и выходных цепей. На боковой поверхности нанесена заводская табличка с маркировкой взрывозащиты. Усилители заряда EX682XYYY устанавливаются на DIN-рейку в электротехническом шкафу, обеспечивающего степень защиты от внешних воздействий не менее IP 54.

Взрывозащищенность преобразователей обеспечивается видом взрывозащиты "Искробезопасная электрическая цепь" по ГОСТ Р 51330.10-99 (МЭК 60079-11-99), ГОСТ 30852.10-2002 (МЭК 60079-11:1999) или защитой вида «nL» (преобразователей 176Мууу) по ГОСТ Р 51330.14-99, ГОСТ 30852.14-2002 а также выполнением их конструкции в соответствии с требованиями ГОСТ Р 51330.0-99 (МЭК 60079-0-98), ГОСТ 30852.0-2002 (МЭК 60079-0:1998).

Взрывозащищенность вибровыключателей 685B*, 685A08 обеспечивается видом взрывозащиты "взрывонепроницаемая оболочка" по ГОСТ Р 51330.1-99 (МЭК 60079-1-98), ГОСТ 30852.1-2002 (МЭК 60079-1:1998) и выполнением их конструкции в соответствии с требованиями ГОСТ Р 51330.0-99 (МЭК 60079-0-98), ГОСТ 30852.0-2002 (МЭК 60079-0:1998).

Взрывозащищенность вибровыключателей 686B* обеспечивается видом взрывозащиты защитой вида "nA" или «nL» по ГОСТ Р 51330.14-99, ГОСТ 30852.14-2002 и выполнением их конструкции в соответствии с требованиями ГОСТ Р 51330.0-99 (МЭК 60079-0-98), ГОСТ 30852.0-2002 (МЭК 60079-0:1998).

Взрывозащищенность усилителей заряда EX682XYYY обеспечивается видом взрывозащиты "Искробезопасная электрическая цепь" по ГОСТ Р 51330.10-99 (МЭК 60079-11-99), ГОСТ 30852.10-2002 (МЭК 60079-11:1999) или защитой вида «nL» по ГОСТ Р 51330.14-99, ГОСТ 30852.14-2002, а также выполнением их конструкции в соответствии с требованиями ГОСТ Р 51330.0-99 (МЭК 60079-0-98), ГОСТ 30852.0-2002 (МЭК 60079-0:1998).

4. МАРКИРОВКА

Маркировка, наносимая на преобразователи, вибровыключатели и усилители заряда, должна включать следующие данные:

- товарный знак или наименование предприятия - изготовителя;
 - тип изделия;
 - заводской номер и год выпуска;
 - маркировку взрывозащиты;
 - специальный знак взрывобезопасности;
 - диапазон температур окружающей среды;
 - наименование или знак центра по сертификации и номер сертификата,
- и другие данные, требуемые нормативной и технической документацией, которые изготовитель должен отразить в маркировке.

5. СПЕЦИАЛЬНЫЕ УСЛОВИЯ ЭКСПЛУАТАЦИИ, ОБОЗНАЧЕННЫЕ ЗНАКОМ X

Знак X, стоящий после маркировки взрывозащиты, означает, что при эксплуатации преобразователей необходимо соблюдать следующие "специальные" условия:

- преобразователи с искробезопасными входными цепями должны подключаться ко вторичной аппаратуре с выходными искробезопасными цепями уровня "ia", сертифицированной в установленном порядке для подключения устройств, находящихся во взрывоопасных зонах помещений и наружных установок, где возможно образование взрывоопасной газовой смеси категории IIIC;
- искробезопасные параметры выходных цепей вторичной аппаратуры, с учетом параметров соединительного кабеля, должны соответствовать входным искробезопасным параметрам преобразователей (п.п. 2.5 – 2.7);
- усилители заряда EX682ХYYY должны устанавливаться в электротехническом шкафу, обеспечивающем степень защиты от внешних воздействий не менее IP 54.
- зависимость температурного класса от температуры окружающей среды для преобразователей вибрации 355*:
 - Т6 для $T_a \leq +80^{\circ}\text{C}$;
 - Т5 для $T_a \leq +95^{\circ}\text{C}$;
 - Т4 для $T_a \leq +130^{\circ}\text{C}$.

Специальные условия эксплуатации, обозначенные знаком X, должны быть отражены в сопроводительной документации, подлежащей обязательной поставке в комплекте с каждым изделием.

Model Number 176A02	CHARGE OUTPUT PRESSURE SENSOR				Revision: E ECN #: 46623		
Performance	ENGLISH	SI	OPTIONAL VERSIONS Optional versions have identical specifications and accessories as listed for the standard model except where noted below. More than one option may be used.				
Sensitivity(+/-20 %)	6 pC/psi	87 pC/bar					
Measurement Range	725 psi	50 bar					
Maximum Pressure(Total)	2 kpsi	137.9 bar					
Resonant Frequency	≥ 100 kHz	≥ 100 kHz					
Transverse Resonance	>15 kHz	>15 kHz					
Frequency Response(± 5.0 %)	20 kHz	20 kHz	[2][3]				
Non-Linearity	$\leq 1\%$ FS	$\leq 1\%$ FS	[4]				
Environmental							
Acceleration Sensitivity	≤ 0.0036 psi/g	$\leq .00025$ bar/g					
Temperature Range(Continuous)	-94 to 1200 °F	-70 to 650 °C					
Temperature Range(Receptacle)	-76 to 500 °F	-60 to 260 °C					
Temperature Response	See Graph	See Graph	[1]				
Hazardous Area Approval	See Manual	See Manual					
Radiation Exposure Limit(Integrated Neutron Flux)	1E10 N/cm²	1E10 N/cm²					
Radiation Exposure Limit(Integrated Gamma Flux)	1E8 rad	1E8 rad					
Electrical							
Output Polarity	Differential	Differential					
Capacitance(with cable pin - pin)	150 pF	150 pF	[1]				
Internal Resistance(room temp)	$\geq 10^{12}$ Ohm	$\geq 10^{12}$ Ohm					
Insulation Resistance(room temp)	$\geq 10^{12}$ Ohm	$\geq 10^{12}$ Ohm					
Internal Resistance(1200°F/650°C)	$\geq 50,000$ Ohm	$\geq 50,000$ Ohm					
Insulation Resistance(1200°F/650°C)	$\geq 100,000$ Ohm	$\geq 100,000$ Ohm					
Physical							
Sensing Element	UHT-12™	UHT-12™					
Sensing Geometry	Compression	Compression					
Housing Material	Nickel Alloy	Nickel Alloy					
Sealing	Welded Hermetic	Welded Hermetic					
Electrical Connector	7/16-27 2-Pin	7/16-27 2-Pin					
Cable Type	Hardline	Hardline					
Cable Length	10 ft	3 m					
Weight(with cable)	4.6 oz	130 gm	[1]				
Typical Sensitivity Deviation vs Temperature

ATEX Approved Sensors

Pressure Sensors

(Models 176 Series)

English

This sensor has been approved for Hazardous Locations Directive 94/9/EC, Ex ia IIC Ga and Ex nA IIC Gc, T6 to T530°C/T660°C.

For safe use:

- All applicable local electrical laws must be followed
- The supply electrical parameters must not exceed any of the following values:
 - o $U_o \leq 30V$, $I_o \leq 300mA$, $P_o \leq 1W$, $C \leq 5nF$, $L \leq 500\mu H$
- Ambient operating temperature range:
 - o **-70°C to +520°C or -70°C to +650°C**

Deutsch

Dieser ist genehmigt worden für Gefährliche Orte Direktive 94/9/EC, Ex ia IIC Ga und Ex nA IIC Gc, T6 to T530°C/T660°C.

Für sicheren Gebrauch:

- Alle zutreffenden örtlichen elektrischen Gesetze müssen gefolgt werden
- Die Versorgung elektrische Parameter müssen kein von den Folgenden Werten überschreiten:
 - o $U_o \leq 30V$, $I_o \leq 300mA$, $P_o \leq 1W$, $C \leq 5nF$, $L \leq 500\mu H$
- Umgebungsbedienungstemperaturbereich:
 - o **-70°C to +520°C or -70°C to +650°C**

Français

Ce détecteur a été approuvé pour les Emplacements Hasardeux Directif 94/9/EC, Ex ia IIC Ga et Ex nA IIC Gc, T6 to T530°C/T660°C.

Pour l'usage sûr :

- Toutes lois électriques, locales et applicables doivent être suivies
- La provision les paramètres électriques ne doivent pas dépasser n'importe quel des valeurs suivantes :
 - o $U_o \leq 30V$, $I_o \leq 300mA$, $P_o \leq 1W$, $C \leq 5nF$, $L \leq 500\mu H$
- La gamme de température d'opération Ambiente :
 - o **-70°C to +520°C or -70°C to +650°C**

Italiano

Questo sensore è stato approvato per le Posizioni Pericolose Direttivo 94/9/EC, Ex ia IIC Ga ed Ex nA IIC Gc, T6 to T530°C/T660°C.

Per l'uso sicuro:

- Tutte le leggi applicabili, locali elettriche devono essere seguite
- La provvista i parametri elettrici non devono eccedere qualunque dei valori seguenti: seguenti:
 - o $U_o \leq 30V$, $I_o \leq 300mA$, $P_o \leq 1W$, $C \leq 5nF$, $L \leq 500\mu H$
- la gamma di temperatura di funzionamento di Ambiente:
 - o **-70°C to +520°C or -70°C to +650°C**

Español

Este sensor se ha aprobado para Ubicaciones Peligrosas Directivas 94/9/EC, Ex ia IIC Ga y Ex nA IIC Gc, T6 to T530°C/T660°C.

Para el uso seguro:

- Todas leyes eléctricas, locales y aplicables se deben seguir
- El suministro los parámetros eléctricos no deben exceder cualquiera de los siguientes valores:
 - o $U_o \leq 30V$, $I_o \leq 300mA$, $P_o \leq 1W$, $C \leq 5nF$, $L \leq 500\mu H$
- El Ambiente que opera la gama de la temperatura:
 - o **-70°C to +520°C or -70°C to +650°C**

Русский

Этот датчик был одобрен для Опасной Директивы 94/9/EC Местоположений, Ex ia IIC Ga и Ex nA IIC Gc, T6 to T530°C/T660°C.

Для безопасного использования:

- Все применимые местные электрические законы должны сопровождаться
- Поставка электрические параметры не должна превысить ни одной из следующих ценностей:
 - o $U_o \leq 30V$, $I_o \leq 300mA$, $P_o \leq 1W$, $C \leq 5nF$, $L \leq 500\mu H$
- Окружающий операционный температурный диапазон:
 - o **-70°C to +520°C or -70°C to +650°C**

Drawing Number: 35030

Revision: **G**

ECN Number: 45606

Norsk

Denne sensoren godkjenner for Farlige Plasseringer Direktiv 94/9/EC, Ex ia IIC Ga og Ex nA IIC Gc, T6 to T530°C/T660°C.

Før sikker bruk:

- Alle anvendelige lokale elektriske lover fulgt
- Forsyningen elektriske parametre må ikke overskride noe av de følgende verdiene:
 - o $U_o \leq 30V$, $I_o \leq 300mA$, $P_o \leq 1W$, $C \leq 5nF$, $L \leq 500\mu H$
- Omgivende betjenningsav temperaturrekkevidde:
 - o $-70^{\circ}C$ to $+520^{\circ}C$ or $-70^{\circ}C$ to $+650^{\circ}C$

Nederlands

Deze sensor is goedgekeurd voor gevaarlijke locaties Richtlijn 94/9 / EG Ex ia IIC Ga en Ex nA IIC Gc , T6 to T530°C / T660°C .

Voor veilige gebruik:

- Alle toepasbare plaatselijke elektrische wetten moeten gevuld worden
- De aanbod elektrische parameters moeten de volgende waarde niet overschrijden:
 - o $U_o \leq 30V$, $I_o \leq 300mA$, $P_o \leq 1W$, $C \leq 5nF$, $L \leq 500\mu H$
- Het omgevend bediening temperatuur bereik:
 - o $-70^{\circ}C$ to $+520^{\circ}C$ or $-70^{\circ}C$ to $+650^{\circ}C$

Português

Este sensor foi aprovado para a Diretiva 94/9/EC de Posições Arriscada, Ex ia IIC Ga e Ex nA IIC Gc, T6 to T530°C/T660°C.

Para uso seguro:

- Todas as leis elétricas locais aplicáveis devem ser seguidas
- O estoque parâmetros elétricos não devem exceder qualquer dos seguintes valores:
 - o $U_o \leq 30V$, $I_o \leq 300mA$, $P_o \leq 1W$, $C \leq 5nF$, $L \leq 500\mu H$
- Variedade de temperatura operacional ambiente:
 - o $-70^{\circ}C$ to $+520^{\circ}C$ or $-70^{\circ}C$ to $+650^{\circ}C$

Svensk

Den här sensoren är blitt gillat för Riskabel Lokaliseringarna Direktiv 94/9/ EC Ex ia IIC Ga och Ex nA IIC Gc, T6 to T530°C/T660°C.

För kassaskåp använda :

- All användbar lokal elektrisk lag måste bli följd efter
- Tillförselen som elektriska parametrar inte måste överskrida några av värderar efter:
 - o $U_o \leq 30V$, $I_o \leq 300mA$, $P_o \leq 1W$, $C \leq 5nF$, $L \leq 500\mu H$
- Omgivande opera- temperatur ställa i rad :
 - o $-70^{\circ}C$ to $+520^{\circ}C$ or $-70^{\circ}C$ to $+650^{\circ}C$

Ex ia IIC T1 Ga ($\text{Tamb} \leq +440^{\circ}\text{C}$)
Ex ia IIC T530°C Ga ($\text{Tamb} \leq +520^{\circ}\text{C}$)
Ex ia IIC T660°C Ga ($\text{Tamb} \leq +650^{\circ}\text{C}$)

18 ESSENTIAL HEALTH AND SAFETY REQUIREMENTS

Covered by the EN 60079-0:2012 + A11:2013 and EN 60079-11:2012 standards.

19 ROUTINE VERIFICATIONS AND TESTS

None.

Designation model : 176XYY/MZZZ-AA :

- X = A through Z for family code
- YY = 01 through 99 for indicate mounting, diaphragm, cabling or connector variations
- M is optional to indicate metric cable length
- ZZZ = 001 through 999 is optional to indicate cable length in feet (≤ 200 feet) or meters ($\leq 61\text{m}$)
- AA = 01 through 99 is optional to indicate fractional length of cable in inches or centimeters

FR-92260 Fontenay-aux-Roses
France

Documents relative to LCIE certification activites (Certificates, QARs, ExTRs) can be registered under the references "LCI" or "LCIE".

IECEx Certificate of Conformity

Certificate No.: IECEx LCIE 12.0025X

Date of Issue: 2015-08-04

Issue No.: 1

Page 2 of 4

Manufacturer: PCB Piezotronics Inc.
3424 Walden Avenue
Depew, New York 14043
United States of America

Additional Manufacturing location(s):

This certificate is issued as verification that a sample(s), representative of production, was assessed and tested and found to comply with the IEC Standard list below and that the manufacturer's quality system, relating to the Ex products covered by this certificate, was assessed and found to comply with the IECEx Quality system requirements. This certificate is granted subject to the conditions as set out in IECEx Scheme Rules, IECEx 02 and Operational Documents as amended.

STANDARDS:

The electrical apparatus and any acceptable variations to it specified in the schedule of this certificate and the identified documents, was found to comply with the following standards:

IEC 60079-0 : 2011 Explosive atmospheres - Part 0: General requirements

Edition: 6.0

IEC 60079-11 : 2011 Explosive atmospheres - Part 11: Equipment protection by intrinsic safety "i"

Edition: 6.0

This Certificate does not indicate compliance with electrical safety and performance requirements other than those expressly included in the Standards listed above.

TEST & ASSESSMENT REPORTS:

A sample(s) of the equipment listed has successfully met the examination and test requirements as recorded in

Test Report:

FR/LCIE/ExTR12.0028/00

FR/LCIE/ExTR15.0069/00

Page 3 of 4

Schedule

EQUIPMENT:

Equipment and systems covered by this certificate are as follows:

The sensor is made of an hermetically sealed metal housing containing only a piezo-crystal assembly connected to an integral cable (maximum length 61m).

Designation of the model : 176XYY/MZZZ-AA :

X = A through Z for family code

YY = 01 through 99 for indicate mounting, diaphragm, cabling or connector variations

M is optional to indicate metric cable length

ZZZ = 001 through 999 is optional to indicate cable length in feet (\leq 200 feet) or meters (\leq 61m).

AA = 01 through 99 is optional to indicate fractional length of cable in inches or centimeters

Electrical parameters :

Ui : 30V, Ii : 300mA, Pi : 1W, Ci : 5nF, Li : 0,5mH

CONDITIONS OF CERTIFICATION: YES as shown below:

Operating ambient temperature : 0°C to +660°C.

Temperature classification :

Ex ia IIC T6 Ga (Tamb \leq +80°C),

Ex ia IIC T5 Ga (Tamb \leq +95°C),

Ex ia IIC T4 Ga (Tamb \leq +130°C),

Ex ia IIC T3 Ga (Tamb \leq +195°C),

Ex ia IIC T2 Ga (Tamb \leq +290°C),

Ex ia IIC T1 Ga (Tamb \leq +440°C),

Ex ia IIC T530°C Ga (Tamb \leq +520°C),

Ex ia IIC T660°C Ga (Tamb \leq +650°C)

The equipment must be only connected to a certified intrinsically safe equipment. This combination must be compatible regarding intrinsic safety rules.
